

Customer Insights Report

Customer Behavior, Churn Analysis, and
the Value Capture Problem.

Target Dataset: 10,000 Customers
Variables: 8 Behavioral Metrics
Period: 2020-2024

The Executive Reality

The Churn Crisis

~~~50%~~

### Unexplained Churn Risk

Omnipresent across every segment, lifecycle, and season.

## The Value Ceiling

~~\$5,077~~

### Maximum Lifetime Value (LTV)

A flat revenue ceiling. 'Loyal' customers generate nearly identical LTV as 'New' customers (\$4,900–\$5,077).

## The Signal Failure

~~0.0~~

### Behavioral Predictors Found

Frequency, gaps, season, and tenure show zero meaningful correlation with churn.

The data does not yet explain why customers leave.  
That is itself a finding, and it tells us exactly where to look next.

# Testing the Organization's Assumptions

Key Insight: We stress-tested 8 core operational assumptions against customer reality. The transactional data dismantles the business's current understanding of loyalty.

# Myth 1: The Frequency Illusion

|                          |                                                                                  |
|--------------------------|----------------------------------------------------------------------------------|
| The Business Assumption: | "Frequent buyers are loyal buyers."                                              |
| The Data Reality:        | Statistical correlation between frequency and churn is +0.018. Essentially zero. |

## The Churn Equalizer

**Takeaway:** We are generating transactions, not attachment. A customer who buys 15 times is just as likely to leave as someone who bought twice.

## Myth 2: The 'Fading' Customer

**The Business Assumption:** 'Customers go quiet and slowly fade away before churning.'

**The Data Reality:** Typical purchase gaps are virtually identical across all risk bands.

**A 1-to-2 day difference across 10,000 customers is statistically invisible.**

**Standard recency models fail here.**

**Customers leave abruptly—likely driven by a negative event, not gradual disengagement.**

## Myth 3: The Tenure Ceiling

The Business Assumption: "Moving a customer to Loyal drives significant revenue growth."

**The Data Reality: The LTV difference between a New and Loyal customer is exactly \$112.**

Customer progression does not translate to revenue growth.

Time spent in the relationship adds zero incremental value (Correlation: -0.005).

## Myth 4: The Dangerous 'Loyal' Stage

The Business Assumption: "Once customers reach the Loyal stage, they are self-sustaining and safe."

**The Data Reality:** High churn risk does not shrink as customers mature.

**There is no safe harbor.** A customer buying 15 times a year in the 33% high-risk band is not a loyal customer; they are a **high-frequency, high-risk flight liability**.

# The Timing & Acquisition Illusions

## Adopter Supremacy

Early Adopters: LTV \$5,017 | AOV \$109.75 | Churn 0.50

Later Users: LTV \$5,061 | AOV \$110.52 | Churn 0.50

**Conclusion:** Being first to discover a product yields no measurable behavioral premium.

## The Peak & Season Fallacy

|  |  |  |  |
|--|--|--|--|
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |

- All 12 season/time combinations result in identical churn (0.49–0.52).
- Median time to product peak is ~730 days. Fast peaks do not yield higher LTV.

**Conclusion:** Time-based targeting and early product performance are useless proxies for customer quality.

# The Reality Check Matrix

| The Business Assumption                 | The Data Reality                   | The Signal   |
|-----------------------------------------|------------------------------------|--------------|
| Higher purchase frequency = lower churn | No relationship ( $r = 0.018$ )    | 🚩 Unexpected |
| Longer purchase gap = higher churn risk | Identical medians (~47 days)       | 🚩 Unexpected |
| 'Loyal' stage yields highest LTV        | All stages flat at ~\$5,000        | 🚩 Unexpected |
| Longer relationship tenure = more value | No relationship ( $r = -0.005$ )   | 🚩 Unexpected |
| Loyal stage has lowest churn risk       | ~33% high risk in every stage      | 🚩 Unexpected |
| Timing/Seasonality drives loyalty       | Uniform 0.49-0.52 churn across all | — No signal  |
| Early Adopters = higher LTV/Loyalty     | Identical across metrics           | — No signal  |

**Synthesis Note:** Five of our core operational pillars are statistically unsupported. The transactional data is blind to the actual drivers of churn.

## The “Aha” Moment

**“A loyal customer generating the same revenue as a new one is not a loyalty problem. It is a value capture problem.”**

The lack of correlation in the data is not an analytical failure. It is the most important signal we have. It proves definitively that our customers are not leaving based on how they buy. They are leaving based on how they feel.

# The Missing Signal: Transactional vs. Experience Data

## Transactional Data

(What we measure - Flatlining)

1. Purchase Frequency

2. Days Between Orders

3. Lifecycle Tiers

4. Lifecycle Tiers

Result: Measures WHEN they buy.  
Generates 0.0 correlation to churn.

## Experience Data

(What we must capture - The True Drivers)

1. Product Return & Complaint History

2. Customer Service Interaction Logs

3. Pricing Sensitivity & Competitor Activity

4. Single vs. Multi-Category Breadth

Result: Measures WHY they leave. The  
invisible architecture of true attachment.

# Action I: Data Expansion

**Directive:** Stop measuring solely when they buy. Start measuring why they leave.

## Action II: Stop Blind Interventions

**The Mandate: Launch a strict 90-day controlled experiment. Without a baseline, millions in retention spend are currently unmeasurable.**

# Action III: Re-Segment by Value

**Directive:** Abandon frequency-based lifecycle tiers. They provide false comfort and no revenue differentiation.

---

- 1. Isolate the Top 20%:** Segment strictly by actual, realized Lifetime Value, regardless of purchase count.
- 2. Analyze the Anatomy of Value:** Who are these top-tier customers? Are they buying premium AOV items? Are they multi-category?
- 3. Targeted Defensibility:** Apply retention resources heavily to defending this specific revenue block, rather than spreading it evenly across high-frequency/low-value churners.

# Frequency is not loyalty.

Let's stop tracking transactions  
and start capturing actual value.
